QAI

What should the tutor explain next?

AI on Campus / Reply Student Tech Clash 2026

Two students write 42

A $-3(2) + 12(2^2) = 42$

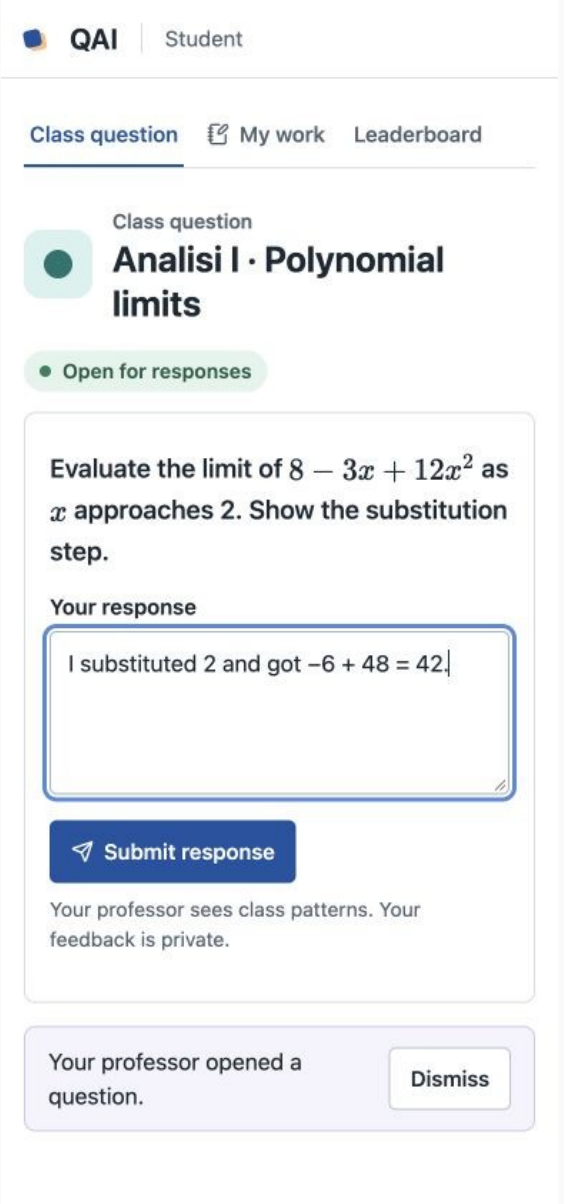

B 42

The exercise was to evaluate $8 - 3x + 12x^2$ as x approaches 2.

One exercise in class

The professor opens a question from their worksheet.

Students scan the QR and send a line of reasoning or a photo of their working.

What the tutor learned

2 of 6 synthetic responses omitted the constant 8 in their working.

One student wrote only “42.” The cause stayed unknown.

Board example **$8 - 3(2) + 12(2^2) = 8 - 6 + 48 = 50$**

How the agent decides

Read the working

Compare the visible step with the approved reference. Ask for more working when the evidence is thin.

Choose a teaching step

Group supported errors across the class. Give the tutor a worked example and a fresh question to check understanding.

A first tutorial pilot

One tutor. Five first-year students. One Analisi I worksheet.

Which step did the tutor change after seeing the report? Can students apply that step on a fresh problem?
